

## Interface AnyType

---

```
public interface AnyType
```

表示 “ 任何引用类型(对象或数组) ” 都允许

This interface type is used in BTrace programs to tell that **any reference type [object or array]** is allowed in the place where it is used. We use that for **method signature matching** when signature needs to be specified loosely. **Note** that we don't want to use java.lang.Object - because user may want to match java.lang.Object exactly.
